Cartoflex produces its honeycomb core directly “in house” to customer specifications and supplies it in:

- blocks for further processing at the customer’s factory;
- individual pieces for manual assembly/treatment;
- in continuous sheets (endless) for automated processes.

It is then packed in wooden pallets and wrapped in extensible film and protective corner pads to ensure optimal protection during transportation and storage. The finished product is delivered in non extended form, thus reducing the weight and volume transported; as a consequence, the costs of handling and storage are reduced to a minimum compared to other bulkier and heavier materials used for similar purposes.
